Distributed-Denial-of-Service Open Threat Signaling (DOTS) Server  
Discovery  
~~draft-ietf-dots-server-discovery-00~~  
~~draft-ietf-dots-server-discovery-01~~

Abstract

It may not be possible for a network to determine the cause for an attack, but instead just realize that some resources seem to be under attack. To fill that gap, Distributed-Denial-of-Service Open Threat Signaling (DOTS) allows a network to inform a DOTS server that it is under a potential attack so that appropriate mitigation actions are undertaken.

This document specifies mechanisms to configure nodes with DOTS servers.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on ~~September 29~~, ~~October 6~~, 2019.

## 1. Introduction

In many deployments, it may not be possible for a network to determine the cause for a distributed Denial-of-Service (DoS) attack [RFC4732], but instead just realize that some resources seem to be under attack. To fill that gap, the IETF is specifying an architecture, called DDoS Open Threat Signaling (DOTS) [I-D.ietf-dots-architecture], in which a DOTS client can inform a DOTS server that the network is under a potential attack and that appropriate mitigation actions are required. Indeed, because the lack of a common method to coordinate a real-time response among involved actors and network domains inhibits the effectiveness of DDoS attack mitigation, DOTS **signal channel** protocol [I-D.ietf-dots-signal-channel] is meant to carry requests for DDoS attack mitigation, thereby reducing the impact of an attack and leading to more efficient defensive actions. [I-D.ietf-dots-use-cases] identifies a set of scenarios for DOTS.

The basic high-level DOTS architecture is illustrated in Figure 1 ([I-D.ietf-dots-architecture]):

Figure 1: Basic DOTS Architecture

[I-D.ietf-dots-architecture] specifies that the DOTS client may be provided with a list of DOTS servers; each associated with one or more IP addresses. These addresses may or may not be of the same address family. The DOTS client establishes one or more DOTS sessions by connecting to the provided DOTS server addresses. The logic for connecting to one or multiple IP addresses is out of scope of this document.

This document specifies methods for DOTS clients to discover their DOTS server(s). The rationale for specifying multiple discovery mechanisms is discussed in Section 4.

Considerations for the selection of DOTS server(s) by multi-homed DOTS clients is out of scope; the reader should refer to ~~[I-D.boucadair-dots-multihoming]~~ [I-D.ietf-dots-multihoming] for more details.

Likewise, happy eyeballs considerations for DOTS are out of scope. The reader should refer to Section 4 of [I-D.ietf-dots-signal-channel].

## ~~2. Requirements Language~~

~~The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this~~

This document assumes that security credentials are provisioned using a variety of means such as those discussed in Section 9. DOTS clients uses those credentials for authentication purposes following [I-D.ietf-dots-signal-channel].

## 2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119][RFC8174] when, and only when, they appear in all capitals, as shown here.

## 3. Terminology

This document makes use of the following terms:

- o DDoS: A distributed Denial-of-Service attack, in which traffic originating from multiple sources are directed at a target on a network. DDoS attacks are intended to cause a negative impact on the availability of servers, services, applications, and/or other functionality of an attack target.

- Furthermore, the reader should be familiar with other terms defined in [I-D.ietf-dots-architecture] and [RFC3958].

It is tempting to specify one single discovery mechanism for DOTS. Nevertheless, the analysis of the various use cases sketched in [I-D.ietf-dots-use-cases] reveals that it is unlikely that one single discovery method can be suitable for all the sample **deployments**

Concretely:

- Consequently, this document describes a unified discovery logic (Section 5) which involves the ~~use of anycast may simplify~~ following mechanisms:

- ## 5. Unified DOTS Discovery Procedure

A key point in the ~~enterprise network to discover a deployment of DOTS gateway, if~~ is the ~~enterprise ability of network is single-homed.~~

- o Many use cases discussed in [I-D.ietf-dots-use-cases] do involve a CPE device. Multiple CPEs, connected operators to distinct network providers may even be considered. It is intuitive to leverage on existing mechanisms such as discovery using service resolution or DHCP or anycast able to provision the CPE acting as a configure DOTS client clients with the correct DOTS server(s).

Use Case	Requires a CPE	The Network Provider is
----------	----------------	-------------------------

		also the DDoS Mitigation Provider
End customer with single or multiple upstream transit	Yes (Intelligent DDoS mitigation system (IDMS) acting as server(s) information consistently. To accomplish this, operators will need a consistent set of ways in which DOTS provider(s) offering DDoS mitigation services	Yes
End customer with an overlay DDoS mitigation managed	Yes (DDoS-Detector acting as clients can discover this information, and a DOTS client	No
may consistent priority among these options. If some devices prefer manual configuration over DNS discovery, while others prefer DNS discovery over manual configuration, the result will be co-located on the CPE)		
security service provider (MSSP)	the CPE)	
End customer operating an application or service with an integrated DOTS client	Yes (CPE may act as a DOTS gateway)	Yes/No
End customer operating a CPE network infrastructure device with an integrated DOTS client	Yes (CPE acts as a DOTS client)	Yes
Suppression of outbound DDoS traffic originating from a consumer broadband access network	Yes (CPE acts as a DOTS server)	Yes
DDoS Orchestration	No	N/A

Table 1- Summary of DOTS Use Cases

Consequently, this document describes the following mechanisms for discovery:

- o A resolution mechanism based on straightforward Naming Authority Pointer (S NAPTR) resource records in the Domain Name System (DNS).
- o DNS Service Discovery.
- o Discovery using DHCP Options.
- o A mechanism based on anycast address for DOTS usage.

## 5. Discovery Procedure

A key point in the deployment of DOTS is the ability of network operators to be able to configure DOTS clients with the correct server information consistently. To accomplish this, operators will need a consistent set of ways in which DOTS clients can discover this information, and a consistent priority among these options. If some devices prefer manual configuration over DNS discovery, while others prefer DNS discovery over manual configuration, the result will be a process of "whack-a-mole", where a process of "whack-a-mole", where the operator must find devices that are using the wrong DOTS server, server(s), determine how to ensure the devices are configured properly, and then reconfigure the device through the preferred method.

All DOTS clients MUST support at least one of the ~~four~~ **three** mechanisms below to determine a DOTS server list. All DOTS clients SHOULD implement all ~~four~~, **three**, or as many as are practical for any specific device, of these ways to discover DOTS servers, in order to facilitate the deployment of DOTS in large scale environments:

### 1. Explicit configuration:

- \* Local/Manual configuration: A DOTS client, will learn the DOTS server(s) by means of local or manual DOTS configuration (i.e., DOTS servers configured at the system level). Configuration discovered from a DOTS client application is considered as local configuration. An implementation may give the user an opportunity (e.g., by means of configuration file options or menu items) to specify DOTS server(s) for each address family. These MAY be specified either as IP addresses or the DNS name of a DOTS server. When only DOTS server's IP addresses are configured, a reference identifier must also be configured for authentication purposes.
- \* Automatic configuration (e.g., DHCP, an automation system): The DOTS client attempts to discover DOTS server(s) names and/or addresses from DHCP, as described in Section ~~9~~ **6**.

### 2. Service Resolution : The DOTS client attempts to discover DOTS server name(s) using service resolution, as specified in Section 7.

### 3. DNS SD: DNS Service Discovery. The DOTS client attempts to discover DOTS server name(s) using DNS service discovery, as specified in Section 8.

### 4. Anycast : Send DOTS request to establish a DOTS session with the assigned DOTS server anycast address for each combination of

~~interface and address family.~~

Some of these mechanisms imply the use of DNS to resolve the IP ~~address~~ **address(es)** of the DOTS server, while others imply ~~the an~~ IP address of the relevant DOTS server is obtained directly. Implementation options may vary on a per device basis, as some devices may not have DNS capabilities and/or proper configuration.

**Clients**

**DOTS clients** will prefer information received from the discovery methods in the order listed.

On hosts with more than one interface or address family (IPv4/v6), the DOTS server discovery procedure has to be performed for each combination of interface and address family. A client MAY choose to perform the discovery procedure only for a desired interface/address combination if the client does not wish to discover a DOTS server for all combinations of interface and address family.

The above procedure MUST also be followed by a DOTS gateway.

**6. Resolution**~~Once~~

The discovery method MUST be reiterated upon the ~~DOTS-client-has-retrieved-client's-DNS-domain-or~~ following events:

- o Expiry of a lease associated with a discovered ~~the~~ DOTS server.
- o Expiry of a DOTS server's certificate currently in use.
- o Attachment to a new network.

**6. DHCP Options for DOTS**

As reported in Section 1.7.2 of [RFC6125]:

"few certification authorities issue server ~~name~~ certificates based on IP addresses, but preliminary evidence indicates that ~~needs~~ such certificates are a very small percentage (less than 1%) of issued certificates".

In order to ~~be resolved, an S NAPTR lookup~~ with ~~"DOTS" application service~~ allow for PKIX-based authentication between a DOTS client and server while accommodating for the ~~desired protocol tag is made~~ to obtain information necessary current best practices for issuing certificates, this document allows for configuring names to ~~connect~~ DOTS clients. These names can be used for two purposes: to retrieve the ~~authoritative list of IP addresses of a DOTS server within the given domain.~~

~~This specification defines "DOTS" as an application service tag (Section 12.3.1) and "signal.udp" (Section 12.3.2), "signal.tcp" (Section 12.3.3), and "data.tcp" (Section 12.3.4) or to be presented as application protocol tags.~~

~~In a~~ reference identifier for authentication purposes.

Defining the ~~example below,~~ option to include a list of IP addresses would avoid a dependency on an underlying name resolution, but that design requires to also supply a name for ~~domain-example.net,~~ PKIX-based authentication purposes.

**6.1. DHCPv6 DOTS Options****6.1.1. Format of DOTS Reference Identifier Option**

The DHCPv6 DOTS option is used to configure a name of the ~~resolution~~ ~~algorithm will result~~ DOTS server. The format of this option is shown in ~~IP address(es), port, tag and protocol tuples as follows:~~

```
example.net.
IN NAPTR 100 10 "" DOTS:signal.udp "" signal.example.net.
IN NAPTR 200 10 "" DOTS:signal.tcp "" signal.example.net.
IN NAPTR 300 10 "" DOTS:data.tcp "" data.example.net.

signal.example.net.
IN NAPTR 100 10 S DOTS:signal.udp "" _dots._signal._udp.example.net.
IN NAPTR 200 10 S DOTS:signal.tcp "" _dots._signal._tcp.example.net.

data.example.net.
IN NAPTR 100 10 S DOTS:data.tcp "" _dots._data._tcp.example.net.

_dots._signal._udp.example.net.
IN SRV 0 0 5000 a.example.net.

_dots._signal._tcp.example.net.
IN SRV Figure 2.

```

```

+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| Order | OPTION_V6_DOTS | Protocol | Option-length | IP-address |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| Port  | Tag             |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

Figure 2: DHCPv6 DOTS Reference Identifier option

The fields of the option shown in Figure 2 are as follows:

- o Option-code: OPTION\_V6\_DOTS\_RI (TBA1, see Section 10.1)
- o Option-length: Length of the dots-server-name field in octets.
- o dots-server-name: A fully qualified domain name of the DOTS server. This field is formatted as specified in Section 10 of [RFC8415].

An example of the dots-server-name encoding is shown in Figure 3. This example conveys the FQDN "dots.example.com.".

~~If no DOTS-specific S-NAPTR records can be retrieved, the discovery procedure fails for this domain name (and the corresponding interface and IP protocol version). If more domain names are known, the discovery procedure MAY perform the corresponding S-NAPTR lookups immediately. However, before retrying a lookup that has failed, a DOTS client MUST wait a time period that is appropriate for the encountered error (e.g., NXDOMAIN, timeout, etc.).~~

## 7. Discovery using Service Resolution

~~This mechanism is performed in two steps:~~

- ~~1. A DNS domain name is retrieved for each combination of interface and address family.~~
- ~~2. Retrieved DNS domain names are then used for S-NAPTR lookups. Further DNS lookups may be necessary to determine DOTS server IP address(es).~~

### 7.1. Retrieving Domain Name

~~A DOTS client has to determine the domain in which it is located. The following section describes the means to obtain the domain name from DHCP. Other means of retrieving domain names may be used, which are outside the scope of this document, e.g., local configuration.~~

~~Implementations MAY allow the user to specify a default name that is used, if no specific name has been configured.~~

#### 7.1.1. DHCP

~~DHCP can be used to determine the domain name related to an interface's point of network attachment. Network operators may provide the domain name to be used for service discovery within an access network using DHCP. Sections 3.2 and 3.3 of [RFC5986] define DHCP IPv4 and IPv6 access network domain name options, OPTION\_V4\_ACCESS\_DOMAIN and OPTION\_V6\_ACCESS\_DOMAIN respectively, to identify a domain name that is suitable for service discovery within the access network.~~

~~For IPv4, the discovery procedure MUST request the access network domain name option in a Parameter Request List option, as described in [RFC2131]. [RFC2132] defines the DHCP IPv4 domain name option, while this option is less suitable, a client MAY request for it if the access network domain name defined in [RFC5986] is not available.~~

~~For IPv6, the discovery procedure MUST request for the access network domain name option in an Options Request Option (ORO) within an Information request message, as described in [RFC3315].~~

~~If neither option can be retrieved the procedure fails for this interface. If a result can be retrieved it will be used as an input for S-NAPTR resolution discussed in Section 6.~~

## 8. DNS Service Discovery

~~DNS-based Service Discovery (DNS-SD) [RFC6763] and Multicast DNS (mDNS) [RFC6762] provide generic solutions for discovering services. DNS-SD/mDNS define a set of naming rules for certain DNS record types that they use for advertising and discovering services.~~

### 8.1. DNS-SD

~~Section 4.1 of [RFC6763] specifies that a service instance name in DNS-SD has the following structure:~~

~~<Instance> . <Service> . <Domain>~~

~~The <Domain> portion specifies the DNS sub-domain where the service instance is registered. It may be "local.", indicating the mDNS local domain, or it may be a conventional domain name such as "example.com."~~

~~The <Service> portion of the DOTS service instance name MUST be "\_dots.\_signal.\_udp" or "\_dots.\_signal.\_tcp" or "\_dots.\_data.\_tcp".~~

### 8.2. mDNS

~~A DOTS client can proactively discover DOTS servers being advertised in the site by multicasting a PTR query to one or all of the following:~~

- ~~o "\_dots.\_signal.\_udp.local."~~

o "\_dots.\_signal.\_tcp.local."

o "\_dots.\_data.\_tcp.local."

A DOTS server can send out gratuitous multicast DNS answer packets whenever it starts up, wakes from sleep, or detects a change in network configuration. DOTS clients receive these gratuitous packets and cache information contained in it.

## 9. DHCP Options for DOTS

As reported in Section 1.7.2 of [RFC6125]:

"few certification authorities issue server certificates based on IP addresses, but preliminary evidence indicates that such certificates are a very small percentage (less than 1%) of issued certificates".

In order to allow for PKIX-based authentication between a DOTS client and server while accommodating for the current best practices for issuing certificates, this document allows for configuring names to DOTS clients. These names can be used for two purposes: to retrieve the list of IP addresses of a DOTS server or to be presented as a reference identifier for authentication purposes.

Defining the option to include a list of IP addresses would avoid a dependency on an underlying name resolution, but that design requires to also supply a name for PKIX-based authentication purposes.

### 9.1. DHCPv6 DOTS Options

#### 9.1.1. Format of DOTS Reference Identifier Option

The DHCPv6 DOTS option is used to configure a name of the DOTS server. The format of this option is shown in Figure 2.

Figure 2: DHCPv6 DOTS Reference Identifier option

The fields of the option shown in Figure 2 are as follows:

- o Option code: OPTION\_V6\_DOTS\_RI (TBA1, see Section 12.1)
- o Option length: Length of the dots-server-name field in octets.
- o dots-server-name: A fully-qualified domain name of the DOTS server. This field is formatted as specified in Section 8 of [RFC3315].

An example of the dots-server-name encoding is shown in Figure 3. This example conveys the FQDN "dots.example.com."

Figure 3: An example of the dots-server-name encoding

#### 9.1.2. Format of DOTS Address Option

The DHCPv6 DOTS option 0x03 | c | o | m | 0x00 |

Figure 3: An example of the dots-server-name encoding

#### 6.1.2. Format of DOTS Address Option

The DHCPv6 DOTS option can be used to configure a list of IPv6 addresses of a DOTS server. The format of this option is shown in Figure 4.

Figure 4: DHCPv6 DOTS Address option

The fields of the option shown in Figure 4 are as follows:

- o Option-code: OPTION\_V6\_DOTS\_ADDRESS (TBA2, see Section 12.1)
- o Option-length: Length of the 'DOTS ipv6-address(es)' field in octets. MUST be a multiple of 16.
- o DOTS ipv6-address: Includes one or more IPv6 addresses [RFC4291] of the DOTS server to be used by the DOTS client.

Note, IPv4-mapped IPv6 addresses (Section 2.5.5.2 of [RFC4291]) are allowed to be included in this option.

To return more than one DOTS servers to the requesting DHCPv6 client, the DHCPv6 server returns multiple instances of OPTION\_V6\_DOTS.

~~9.1.3.~~

### 6.1.3. DHCPv6 Client Behavior

DHCP clients MAY request options OPTION\_V6\_DOTS\_RI and OPTION\_V6\_DOTS\_ADDRESS, as defined in ~~{RFC3315}, [RFC8415]~~, Sections ~~17.1.1, 18.1.1, 18.1.3, 18.1.4, 18.1.5, 18.2.1, 18.2.2, 18.2.4, 18.2.5, 18.2.6, and 22.7.~~ 21.7. As a convenience to the reader, it is mentioned here that the DHCP client includes the requested option codes in the Option Request Option.

If the DHCP client receives more than one instance of OPTION\_V6\_DOTS\_RI (resp. OPTION\_V6\_DOTS\_ADDRESS) option, it MUST use only the first instance of that option.

If the DHCP client receives both OPTION\_V6\_DOTS\_RI and OPTION\_V6\_DOTS\_ADDRESS, the content of OPTION\_V6\_DOTS\_RI is used as reference identifier for authentication purposes (e.g., PKIX [RFC6125]), while the addresses included in OPTION\_V6\_DOTS\_ADDRESS are used to reach the DOTS server. In other words, the name conveyed in OPTION\_V6\_DOTS\_RI MUST NOT be passed to underlying resolution library in the presence of OPTION\_V6\_DOTS\_ADDRESS in a response.

If the DHCP client receives OPTION\_V6\_DOTS\_RI only, but OPTION\_V6\_DOTS\_RI option contains more than one name, as distinguished by the presence of multiple root labels, the DHCP client MUST use only the first name. Once the name is validated (Section 8 of ~~{RFC3315}, [RFC8415]~~), the name is passed to a name resolution library. Moreover, that name is also used as a reference identifier for authentication purposes.

If the DHCP client receives OPTION\_V6\_DOTS\_ADDRESS only, the address(es) included in OPTION\_V6\_DOTS\_ADDRESS is used to reach the DOTS server. In addition, these addresses can be used as identifiers for authentication.

~~9.2.~~

### 6.2. DHCPv4 DOTS Options

~~9.2.1.~~

#### 6.2.1. Format of DOTS Reference Identifier Option

The DHCPv4 DOTS option is used to configure a name of the DOTS server. The format of this option is illustrated in Figure 5.

```

Code Length  DOTS server name
+-----+-----+-----+-----+-----+-----+
| TBA | n | s1 | s2 | s3 | s4 | s5 | ...
+-----+-----+-----+-----+-----+-----+

```

The values s1, s2, s3, etc. represent the domain name labels in the domain name encoding.

Figure 5: DHCPv4 DOTS Reference Identifier option

The fields of the option shown in Figure 5 are as follows:

- o Code: OPTION\_V4\_DOTS\_RI (TBA3, see Section ~~12.2~~ 10.2);
- o Length: Includes the length of the "DOTS server name" field in octets; the maximum length is 255 octets.
- o DOTS server name: The domain name of the DOTS server. This field is formatted as specified in Section 8 10 of ~~{RFC3315},~~

~~9.2.2. [RFC8415].~~

#### 6.2.2. Format Format of DOTS Address Option

The DHCPv4 DOTS option can be used to configure a list of IPv4 addresses of a DOTS server. The format of this option is illustrated in Figure 6.

```

0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5
+-----+-----+-----+-----+-----+-----+
| Code | Length |

```

Figure 6: DHCPv4 DOTS Address option

The fields of the option shown in Figure 6 are as follows:

- o Code: OPTION\_V4\_DOTS\_ADDRESS (TBA4, see Section ~~12.2~~ 10.2);
- o Length: Length of all included data in octets. The minimum length

- is 5.
- o List-Length: Length of the "List of DOTS IPv4 Addresses" field in octets; MUST be a multiple of 4.
  - o List of DOTS IPv4 Addresses: Contains one or more IPv4 addresses of the DOTS server to be used by the DOTS client. The format of this field is shown in Figure 7.
  - o OPTION\_V4\_DOTS can include multiple lists of DOTS IPv4 addresses; each list is treated separately as it corresponds to a given DOTS server.

When several lists of DOTS IPv4 addresses are to be included, "List-Length" and "DOTS IPv4 Addresses" fields are repeated.

```

0      8      16      24      32      40      48
+-----+-----+-----+-----+-----+-----+
| a1 | a2 | a3 | a4 | a1 | a2 | ...
+-----+-----+-----+-----+-----+
IPv4 Address 1      IPv4 Address 2 ...

```

This format assumes that an IPv4 address is encoded as a1.a2.a3.a4.

Figure 7: Format of the List of DOTS IPv4 Addresses

OPTION\_V4\_DOTS is a concatenation-requiring option. As such, the mechanism specified in [RFC3396] MUST be used if OPTION\_V4\_DOTS exceeds the maximum DHCPv4 option size of 255 octets.

### 9.2.3.

#### 6.2.3. DHCPv4 Client Behavior

To discover a DOTS server, the DHCPv4 client MUST include both OPTION\_V4\_DOTS\_RI and OPTION\_V4\_DOTS\_ADDRESS in a Parameter Request List Option [RFC2132].

If the DHCP client receives more than one instance of OPTION\_V4\_DOTS\_RI (resp. OPTION\_V4\_DOTS\_ADDRESS) option, it MUST use only the first instance of that option.

If the DHCP client receives both OPTION\_V4\_DOTS\_RI and OPTION\_V4\_DOTS\_ADDRESS, the content of OPTION\_V4\_DOTS\_RI is used as reference identifier for authentication purposes, while the addresses included in OPTION\_V4\_DOTS\_ADDRESS are used to reach the DOTS server. In other words, the name conveyed in OPTION\_V4\_DOTS\_RI MUST NOT be passed to underlying resolution library in the presence of OPTION\_V4\_DOTS\_ADDRESS in a response.

If the DHCP client receives OPTION\_V4\_DOTS\_RI only, but OPTION\_V4\_DOTS\_RI option contains more than one name, as distinguished by the presence of multiple root labels, the DHCP client MUST use only the first name. Once the ~~name is validated~~

~~(Section 8 of [RFC3315]), name is validated~~  
(Section 10 of [RFC8415]), the name is passed to a name resolution library. Moreover, that name is also used as a reference identifier for authentication purposes.

If the DHCP client receives OPTION\_V4\_DOTS\_ADDRESS only, the address(es) included in OPTION\_V4\_DOTS\_ADDRESS is used to reach the DOTS server. In addition, these addresses can be used as identifiers for authentication.

## 7. Discovery using Service Resolution

This mechanism is performed in two steps:

1. A DNS domain name is retrieved for each combination of interface and address family. A DOTS client has to determine the domain in which it is located relying on dynamic means such as DHCP (Section 6). Implementations MAY allow the user to specify a default name that is used, if no specific name has been configured.
2. Retrieved DNS domain names are then used for S-NAPTR lookups. Further DNS lookups may be necessary to determine DOTS server IP address(es).

Once the DOTS client has retrieved client's DNS domain or discovered the DOTS server name ~~is passed to a name resolution library. Moreover, that name is also used as a reference identifier for authentication purposes.~~

~~If the DHCP client receives OPTION\_V4\_DOTS\_ADDRESS only, needs to be resolved (e.g., Section 6), an S-NAPTR lookup with 'DOTS' application service and the address(es) included in OPTION\_V4\_DOTS\_ADDRESS desired protocol tag is used made to obtain information necessary to connect to reach the authoritative DOTS server. In addition, these addresses can be used~~ server within the given domain.

This specification defines "DOTS" as ~~identifiers~~ an application service tag (Section 10.3.1) and "signal.udp" (Section 10.3.2), "signal.tcp" (Section 10.3.3), and "data.tcp" (Section 10.3.4) as application protocol tags.

In the example below, for ~~authentication.~~

~~10. Anycast domain 'example.net', the resolution algorithm will result in IP anycast address(es), port, tag and protocol tuples as follows:~~

```

example.net.
IN NAPTR 100 10 "" DOTS:signal.udp "" signal.example.net.
IN NAPTR 200 10 "" DOTS:signal.tcp "" signal.example.net.
IN NAPTR 300 10 "" DOTS:data.tcp "" data.example.net.

signal.example.net.
IN NAPTR 100 10 S DOTS:signal.udp "" _dots_signal_udp.example.net.
IN NAPTR 200 10 S DOTS:signal.tcp "" _dots_signal_tcp.example.net.

```

```

data.example.net.
IN NAPTR 100 10 S DOTS:data.tcp "" _dots._data._tcp.example.net.

_dots._signal._udp.example.net.
IN SRV 0 0 5000 a.example.net.

_dots._signal._tcp.example.net.
IN SRV 0 0 5001 a.example.net.

_dots._data._tcp.example.net.
IN SRV 0 0 5002 a.example.net.

a.example.net.
IN AAAA 2001:db8::1

```

Order	Protocol	IP address	Port	Tag
1	UDP	2001:db8::1	5000	Signal
2	TCP	2001:db8::1	5001	Signal
3	TCP	2001:db8::1	5002	Data

If no DOTS-specific S-NAPTR records can also be used retrieved, the discovery procedure fails for ~~DOTS service discovery~~. A packet sent to an anycast address is delivered to this domain name (and the 'topologically nearest' network corresponding interface with and IP protocol version). If more domain names are known, the anycast address.

When discovery procedure MAY perform the corresponding S-NAPTR lookups immediately. However, before retrying a lookup that has failed, a DOTS client requires DOTS services, it attempts to establish MUST wait a signaling session with time period that is appropriate for the assigned anycast address(es) defined in Sections 12.4 encountered error (e.g., NXDOMAIN, timeout, etc.).

## 8. DNS Service Discovery

DNS-based Service Discovery (DNS-SD) [RFC6763] provides generic solutions for discovering services. DNS-SD defines a set of naming rules for certain DNS record types that they use for advertising and 12.5. A DOTS server, discovering services.

Section 4.1 of [RFC6763] specifies that receives a DOTS request with an anycast address, SHOULD redirect service instance name in DNS-SD has the DOTS-client to following structure:

```
<Instance> . <Service> . <Domain>
```

The <Domain> portion specifies the appropriate DOTS unicast server(s) using DNS sub-domain where the mechanism described in Section 5.5 of [I-D.ietf-dots-signal-channel], unless it service instance is configured otherwise. Indeed, a DOTS server SHOULD registered. It may be configurable to maintain all DOTS communications using anycast. DOTS redirect is not made mandatory because "local.", indicating the use of anycast is not problematic for some deployment scenarios mDNS local domain, or it may be a conventional domain name such as an enterprise network deploying one single DOTS gateway connected to one single network provider.

[I-D.boucadair-dots-multihoming] identifies a set "example.com."

The <Service> portion of deployment schemes in which the use of anycast is not recommended.

11. DOTS service instance name MUST be "\_dots.\_signal.\_udp" or "\_dots.\_signal.\_tcp" or "\_dots.\_data.\_tcp".

## 9. Security Considerations

DOTS-related security considerations are discussed in Section 4 of [I-D.ietf-dots-architecture] is to be considered. DOTS agents must authenticate each other using (D)TLS before a DOTS session is considered valid.

If the DOTS client is explicitly configured with DOTS server(s) then the DOTS client can also be explicitly configured with credentials to authenticate the DOTS server.

The CPE device acting as a DOTS client MAY may use Bootstrapping Remote Secure Key Infrastructures (BRSKI) discussed in [I-D.ietf-anima-bootstrapping-keyinfra] to automatically bootstrap using the vendor installed X.509 certificate, in combination with a domain registrar provided by the upstream transit provider and vendor's authorizing service. The CPE device authenticates to the upstream transit provider using the vendor installed X.509 certificate and the upstream transit provider validates the vendor installed certificate on the CPE device using the Manufacturer Authorized Signing Authority (MASA) service. If authentication is successful then the CPE device can request and get a voucher from the MASA service via the domain registrar. The voucher is signed by the MASA service and includes the upstream transit provider's trust anchor certificate. The CPE device validates the signed voucher using the manufacturer installed trust anchor associated with the vendor's selected MASA service and stores the upstream transit provider's trust anchor certificate. The CPE device then uses Enrollment over Secure Transport (EST) [RFC7030] for certificate enrollment (Section 3.8 in [I-D.ietf-anima-bootstrapping-keyinfra]). The DOTS client on the CPE device can authenticate to the DOTS server using the certificate provisioned by the EST server and the DOTS client can validate the DOTS server certificate using the upstream transit provider's trust anchor certificate it had received in the voucher.

~~11.1.~~  
voucher.

Likewise, a CPE device may rely on the Secure Zero Touch Provisioning (SZTP) discussed in [I-D.ietf-netconf-zero-touch] when bootstrapping.

## 9.1. DHCP

The security considerations in [RFC2131] and ~~{RFC3335}~~ [RFC8415] are to be considered.

~~11.2.~~

## 9.2. Service Resolution

The primary attack against the methods described in Section 7 is one that would lead to impersonation of a DOTS server. An attacker could attempt to compromise the S-NAPTR resolution. The use of mutual authentication makes it difficult to redirect a DOTS client to an illegitimate DOTS server.

~~11.3.~~

## 9.3. DNS Service Discovery

Since DNS-SD is just a specification for how to name and use records in the existing DNS system, it has no specific additional security requirements over and above those that already apply to DNS queries and DNS updates. For DNS queries, DNS Security Extensions (DNSSEC) [RFC4033] SHOULD be used where the authenticity of information is important. For DNS updates, secure updates [RFC2136][RFC3007] SHOULD generally be used to control which clients have permission to update DNS records.

~~For mDNS, in addition to what has been described above, a principal security threat is a security threat inherent to IP multicast routing and any application that runs on it. A rogue system can advertise that it is a DOTS server. Discovery of such rogue systems as DOTS servers, in itself, is not a security threat if the DOTS client authenticates the discovered DOTS servers.~~

~~11.4. Anycast~~

~~Anycast-related security considerations are discussed in [RFC4786] and [RFC7094].~~

~~12.~~

## 10. IANA Considerations

IANA is requested to allocate the SRV service name of "\_dots.\_signal" for DOTS signal channel over UDP or TCP, and the service name of "\_dots.\_data" for DOTS data channel over TCP.

~~12.1.~~

## 10.1. DHCPv6 Option

IANA is requested to assign the following new DHCPv6 Option Code in the registry maintained in <http://www.iana.org/assignments/dhcpv6-parameters/>:

Option Name	Value
OPTION_V6_DOTS_RI	TBA1
OPTION_V6_DOTS_ADDRESS	TBA2

~~12.2.~~

## 10.2. DHCPv4 Option

IANA is requested to assign the following new DHCPv4 Option Code in the registry maintained in <http://www.iana.org/assignments/bootp-dhcp-parameters/>:

Option Name	Value	Data length	Meaning
OPTION_V4_DOTS_RI	TBA3	Variable; the maximum length is 255 octets.	Includes the name of the DOTS server.
OPTION_V4_DOTS_ADDRESS	TBA4	Variable; the minimum length is 5.	Includes one or multiple lists of DOTS IP addresses; each list is treated as a separate DOTS server.

~~12.3.~~

## 10.3. Application Service &amp; Application Protocol Tags

This document requests IANA to make the following allocations from the registry available at: <https://www.iana.org/assignments/s-naptr-parameters/s-naptr-parameters.xhtml>.

~~12.3.1.~~

## 10.3.1. DOTS Application Service Tag Registration

- o Application Protocol Tag: DOTS
- o Intended Usage: See Section 6 7
- o Security Considerations: See Section 11 9
- o Contact Information: <one of the authors>

### ~~12.3.2. signal.udp Application Protocol Tag Registration~~

#### ~~o Application Protocol Tag:~~

### 10.3.2. signal.udp

#### o Intended Usage: See Section 6

#### ~~o Security Considerations: See Section 11~~

#### ~~o Contact Information: <one of the authors>~~

### ~~12.3.3. signal.tcp Application Protocol Tag Registration~~

#### ~~o Application Protocol Tag: signal.tcp~~

#### ~~o Intended Usage: See Section 6~~

#### ~~o Security Considerations: See Section 11~~

#### ~~o Contact Information: <one of the authors>~~

### ~~12.3.4. data.tcp Application Protocol Tag Registration~~

#### o Application Protocol Tag: data.tcp

#### ~~o Intended Usage: See Section 6~~

#### ~~o Security Considerations: See Section 11~~

#### ~~o Contact Information: <one of the authors>~~

### 12.4. IPv4 Anycast

~~IANA has assigned a single IPv4 address from the 192.0.0.0/24 prefix and registered it in the "IANA IPv4 Special Purpose Address Registry" [RFC6890].~~

Attribute	Value
Address Block	TBA
Name	Distributed Denial-of-Service Open Threat Signaling (DOTS) Anycast
RFC	<this document>
Allocation Date	<date of approval of this document>
Termination Date	N/A
Source	True
Destination	True
Forwardable	True
Global	True
Reserved by Protocol	False

### 12.5. IPv6 Anycast

~~IANA has assigned a single IPv6 address from the 2001:0000::/23 prefix and registered it in the "IANA IPv6 Special Purpose Address Registry" [RFC6890].~~

Attribute	Value
Address Block	TBA
Name	Distributed Denial-of-Service Open Threat Signaling (DOTS) Anycast
RFC	<this document>
Allocation Date	<date Application Protocol Tag: signal.udp>

#### o Intended Usage: See Section 7

#### o Security Considerations: See Section 9

#### o Contact Information: <one of approval the authors>

### 10.3.3. signal.tcp Application Protocol Tag Registration

#### o Application Protocol Tag: signal.tcp

#### o Intended Usage: See Section 7

#### o Security Considerations: See Section 9

#### o Contact Information: <one of this document>

Termination Date	N/A
Source	True
Destination	True
Forwardable	True
Global	True
Reserved by Protocol	False

### ~~13. the authors>~~

### 10.3.4. data.tcp Application Protocol Tag Registration

#### o Application Protocol Tag: data.tcp

#### o Intended Usage: See Section 7

#### o Security Considerations: See Section 9

#### o Contact Information: <one of the authors>

## 11. Acknowledgements

Thanks to Brian Carpenter for the review of the BRSKI text.

Many thanks to Russ White for the review, comments, and text contribution.

~~14.~~

Thanks for Dan Wing and Pei Wei for the review and comments.
